

(18.1) "Reference man" consists of 18% C, 66% H₂O, 0.2% of K per body weight. He may also have accumulated 10 pCi ²²⁶Ra in the body; assume 0.3 decay for each of the following 5 daughters. Calculate for a body weight of 70 kg the number of radioactive decays per unit time from ³H, ¹⁴C, ⁴⁰K and ²²⁶Ra. Assume 30 TU in water.

Units, constants and data:

$$\begin{array}{lll}
 N_A := 6.022137 \cdot 10^{23} \cdot \text{mole}^{-1} & \text{Bq} := \text{sec}^{-1} & \text{kBq} := 1000 \cdot \text{Bq} \\
 \rho_{\text{water}} := 1.0 \cdot \text{gm} \cdot \text{cm}^{-3} & \text{TU} := 118 \cdot \text{Bq} \cdot \text{m}^{-3} & \text{See §5.1.2 for definition} \\
 m_{\text{water}} := 70 \cdot \frac{66}{100} \cdot \text{kg} & m_{\text{carbon}} := 70 \cdot \frac{18}{100} \cdot \text{kg} & m_{\text{potassium}} := 70 \cdot \frac{0.2}{100} \cdot \text{kg} \\
 M_K := 39.10 \cdot \text{gm} \cdot \text{mole}^{-1} & x_{40K} := 0.0117 \cdot \% & \text{From Table 5.2}
 \end{array}$$

(1) Tritium

$$v_{\text{water}} := \frac{m_{\text{water}}}{\rho_{\text{water}}} \qquad R_T := 30 \cdot \text{TU} \cdot v_{\text{water}} \qquad R_T = 163.5 \cdot \text{Bq} \qquad \text{Of } ^3\text{H}$$

(2) ¹⁴C (see §5.1.3 for specific activity)

$$S_C := \frac{13.56}{60} \cdot \text{Bq} \cdot \text{gm}^{-1} \qquad R_{14C} := m_{\text{carbon}} \cdot S_C \qquad R_{14C} = 2.85 \cdot \text{kBq}$$

(3) ⁴⁰K

$$t_{\text{half}40K} := 1.26 \cdot 10^9 \cdot \text{yr} \qquad \lambda_{40K} := \frac{\ln(2)}{t_{\text{half}40K}}$$

$$R_{40K} := \frac{m_{\text{potassium}}}{M_K} \cdot N_A \cdot x_{40K} \cdot \lambda_{40K} \qquad R_{40K} = 4.40 \cdot \text{kBq}$$

(4) ²²⁶Ra and daughters

$$R_{Ra} := 10 \cdot 10^{-12} \cdot 3.7 \cdot 10^{10} \cdot \text{Bq} \qquad R_{Ra} = 0.37 \cdot \text{Bq} \qquad (\text{this value will be needed in 18.2})$$

$$R_{\text{Ratot}} := (1.0 + 5 \cdot 0.3) \cdot R_{Ra} \qquad R_{\text{Ratot}} = 0.93 \cdot \text{Bq}$$

$$\text{Total} := R_T + R_{14C} + R_{40K} + R_{\text{Ratot}} \qquad \text{Total} = 7.41 \cdot \text{kBq}$$
