

(5.9) A hospital has a 1.5 Ci source of  $^{226}\text{Ra}$  in the form of  $\text{RaBr}_2$  solution. If the  $^{222}\text{Rn}$  is pumped out each 48 h, what is (a) the radon activity (in Bq) at that moment, (b) the radon volume at STP?

First the usual definitions of various constants:

$$\begin{aligned}
 \text{Bq} &:= \text{sec}^{-1} & \text{Ci} &:= 3.7 \cdot 10^{10} \cdot \text{Bq} & M_{\text{Ra}} &:= 226 \cdot \frac{\text{gm}}{\text{mole}} & M_{\text{Rn}} &:= 222 \cdot \frac{\text{gm}}{\text{mole}} & M_{\text{Br}} &:= 79.91 \cdot \frac{\text{gm}}{\text{mole}} \\
 N_A &:= 6.022 \cdot 10^{23} \cdot \text{mole}^{-1} & R_{\text{gas}} &:= 0.08206 \cdot \text{liter} \cdot \text{atm} \cdot \text{mole}^{-1} \cdot \text{K}^{-1} & M_{\text{RaBr}_2} &:= M_{\text{Ra}} + 2 \cdot M_{\text{Br}}
 \end{aligned}$$

Then the values given in Table 5.1 for half-lives:

$$\begin{aligned}
 t_{226} &:= 1600 \cdot \text{yr} & t_{222} &:= 3.825 \cdot \text{day} \\
 \lambda_{226} &:= \frac{\ln(2)}{t_{226}} & \lambda_{222} &:= \frac{\ln(2)}{t_{222}} & \text{Eqn. (5.62)}
 \end{aligned}$$

We need also the activity of  $^{226}\text{Ra}$  in the source, which is given as:

$$R_{\text{Ra}} := 1.5 \cdot \text{Ci} \quad R_{\text{Ra}} = 5.55 \cdot 10^{10} \cdot \text{Bq}$$

and the time for buildup of new radon:  $t := 48 \cdot \text{hr}$

$$R_{\text{Rn}} := R_{\text{Ra}} \left( 1 - \exp(-\lambda_{222} \cdot t) \right) \quad \text{Eqn. (5.76) with } R = N \cdot \lambda \quad R_{\text{Rn}} = 1.687 \cdot 10^{10} \cdot \text{Bq}$$

STP corresponds to:  $\text{Temp} := 273.15 \cdot \text{K}$   $p := 1 \cdot \text{atm}$

Number of Rn atoms,  $N_{\text{Rn}}$ , the number of Rn moles,  $n_{\text{Rn}}$ , and the corresponding volume,  $V_{\text{Rn}}$ , are given by:

$$\begin{aligned}
 N_{\text{Rn}} &:= \frac{R_{\text{Rn}}}{\lambda_{222}} & n_{\text{Rn}} &:= \frac{N_{\text{Rn}}}{N_A} & n_{\text{Rn}} &= 1.336 \cdot 10^{-8} \\
 V_{\text{Rn}} &:= \frac{n_{\text{Rn}} \cdot R_{\text{gas}} \cdot \text{Temp}}{p} & & & & \text{(the general gas-law)}
 \end{aligned}$$

Hence:

$$V_{\text{Rn}} = 2.994 \cdot 10^{-10} \cdot \text{m}^3 \quad \text{or} \quad V_{\text{Rn}} = 2.994 \cdot 10^{-7} \cdot \text{liter} \quad \text{or} \quad V_{\text{Rn}} = 2.994 \cdot 10^{-4} \cdot \text{mL}$$
