

(7.8) The  $E_{max}$  of  $^{32}\text{P}$   $\beta$ -particles is 1.71 MeV. To what electron velocity does this correspond?

Begin by defining the rest mass of an electron and the velocity of light (data from Appendices.):

$$m_e := 5.485799 \cdot 10^{-4} \text{ u} \quad c := 299792458 \text{ m/s}$$

The given maximum  $\beta$ -energy is:

$$E_{max} := 1.71 \text{ MeV}$$

In order to convert between mass (in u) and energy (in MeV) use the proportionality constant 931.5 MeV/u.

$$\text{Eqn. (4.21): } m = m^0 + E_{kin}/c^2$$

$$\text{Eqn. (4.19): } m = m^0 (1 - v^2/c^2)^{-1/2}$$

By combining these equations,  $m$  can be eliminated. After some simple algebra we obtain the following equation, where  $\beta$  stands for  $v/c$

$$\beta := \sqrt{1 - \left[ \frac{1}{\left( \frac{E_{max}}{931.5 \cdot m_e} + 1 \right)} \right]^2}$$

$$\beta = 0.9732 \quad (97.3\% \text{ of } c)$$

$$\text{But: } v := \beta c$$

$$\text{and thus: } v = 2.917 \cdot 10^8 \text{ m/s}$$
