

(7.9) In a laboratory an irradiation area must be designed for γ -radiography using a 0.37 TBq ^{60}Co source. For this purpose a cubic building is erected with an interior side length of 2 m. The desired flux reduction is 10^6 . How thick must the wall be and how much will the shielding material cost (i.e. not including labor costs) if it is made of (a) concrete? (b) lead? Assume lead blocks cost \$1.50 per kg and concrete \$40 per m^3 .

From Fig. 7.15 and E_γ 1.17 and 1.33; average 1.25 MeV, the thickness d_{concrete} is obtained as:

$$d_{\text{concrete}} := 133 \cdot 10^{-2} \cdot \text{m}$$

The concrete volume is calculated as the difference in volume between a massive cube and a hollow cube having outer dimension = inner dimension + wall thickness.

$$\text{Volume} := (2 \cdot \text{m} + 2 \cdot d_{\text{concrete}})^3 - (2 \cdot \text{m})^3 \quad \text{Volume} = 93.195 \cdot \text{m}^3$$

$$\text{Unitcost} := 40 \cdot \text{m}^{-3} \quad \text{in } \$/\text{m}^3$$

$$\text{Cost} := \text{Volume} \cdot \text{Unitcost} \quad \text{Cost} = 3.728 \cdot 10^3 \quad \$ \text{ for concrete}$$

From Fig. 7.17 we can read the absorption coefficient for lead as $\mu = 0.059 \text{ cm}^2/\text{g}$ at 1.25 MeV:

$$\rho_{\text{Pb}} := 11.3 \cdot \frac{\text{gm}}{\text{cm}^3} \quad \mu := 0.059 \cdot \frac{\text{cm}^2}{\text{gm}}$$

However, in this case we must also correct for scattered radiation by using the build-up factor, B :

$$B := 1.2 \quad \text{By trial and error using Fig. 7.20}$$

$$x\mu := \frac{\ln(10^6 \cdot B)}{\rho_{\text{Pb}}} \quad x\mu = 0.001 \cdot \text{kg}^{-1} \cdot \text{m}^3$$

$$x := \frac{x\mu}{\mu} \quad x = 0.21 \cdot \text{m}$$

$$\text{Volume}_{\text{Pb}} := (2 \cdot \text{m} + 2 \cdot x)^3 - (2 \cdot \text{m})^3 \quad \text{Volume}_{\text{Pb}} = 6.171 \cdot \text{m}^3$$

$$\text{Unitcost} := 1.50 \cdot \text{kg}^{-1} \quad \text{in } \$/\text{kg}$$

$$\text{Cost}_{\text{Pb}} := \text{Volume}_{\text{Pb}} \cdot \text{Unitcost} \cdot \rho_{\text{Pb}} \quad \text{Cost}_{\text{Pb}} = 1.046 \cdot 10^5 \quad \$ \text{ for Pb}$$
